## 1.1 Overview

ZED-X20P is an innovative all-band receiver module designed to revolutionize positioning technology in industrial applications. Built upon the u-blox new generation receiver platform, this module offers multi-band Global Navigation Satellite System (GNSS) capability, supporting bands including L1, L2, L5 and L6. With its comprehensive coverage, ZED-X20P ensures precise and reliable positioning even in challenging environments, setting a new standard in accuracy.

Equipped with integrated u-blox multi-band real-time kinematic (RTK) and precise point positioning real-time kinematic (PPP-RTK) technologies, ZED-X20P achieves centimeter-level accuracy, enabling precise navigation and automation in industrial and consumer-grade products. Despite its advanced capabilities, ZED-X20P maintains a compact surface-mounted form factor, measuring only 17.0 x 22.0 x 2.4 mm, ensuring seamless integration into various applications without compromising performance.

In this document, RTK refers to an observation state representation (OSR) based solution utilizing radio technical commission for maritime services (RTCM) corrections, while PPP-RTK refers to state space representation (SSR) based solution using secure position augmentation for real-time navigation (SPARTN). With its comprehensive features and advanced technologies, ZED-X20P offers unparalleled accuracy and reliability, making it the ideal choice for applications requiring high-performance positioning solutions.

## 1.3 Supported GNSS constellations

ZED-X20P is a concurrent GNSS receiver that can receive and track multiple GNSS constellations. Owing to the multi-band radio frequency (RF) front-end architecture, all major GNSS constellations (Global Positioning System (GPS), Galileo and BeiDou Navigation Satellite System (BDS)) plus Satellite-Based Augmentation System (SBAS), Quasi-Zenith Satellite System (QZSS), and Navigation with Indian Constellation (NavIC) satellites can be received concurrently on L1, L2, L5 and L6 bands.

If power consumption is a key factor, the receiver can be configured for a subset of GNSS constellations.

<sup>5</sup> Measured with primary output only, secondary output disabled (default)

<sup>6</sup> Depends on atmospheric conditions, baseline length, GNSS antenna, multipath conditions, satellite visibility and geometry

<sup>7</sup> 24 hours static

<sup>8</sup> Measured using 1 km baseline and patch antennas with good ground planes. Does not account for possible antenna phase center offset errors. The ppm limited to baselines up to 20 km.

<sup>9</sup> PointPerfect Flex correction service based on the SPARTN format

<sup>10</sup> Demonstrated with a good external LNA. Measured at room temperature.

All satellites in view can be processed to provide an RTK navigation solution when used with correction data.

To benefit from multi-band signal reception, dedicated hardware preparation must be made during the design-in phase. The default configuration on ZED-X20P is concurrent reception of GPS, Galileo and BeiDou with QZSS and SBAS enabled.

ZED-X20P supports the following GNSS constellations and their signals:

<sup>13</sup> External components required, some pins need to be reconfigured.

SBAS augmentation services. See the Interface description[\[2\]](#) for the UBX-RXM-SFRBX message specification. The receiver can provide satellite signal information in a form compatible with the Radio Resource LCS Protocol (RRLP).

### 1.9.1 Carrier-phase measurements

ZED-X20P provides raw carrier-phase data for all supported signals, along with pseudorange, Doppler and measurement quality information. The data contained in the UBX-RXM-RAWX message follows the conventions of a multi-GNSS RINEX 3 observation file. For the UBX-RXM-RAWX message specification, see Interface description[\[2\]](#).

Raw measurement data is available once the receiver has established data bit synchronization and time-of-week.

## 5 Communications interfaces

The ZED-X20P receiver support communication over UART, SPI and I2C.

All the inputs have internal pull-up resistors in normal operation and can be left open if not used. All the PIOs are supplied by V<sub>IO</sub>, therefore all the voltage levels of the PIO pins are related to V<sub>IO</sub> supply voltage.

### 5.1 UART

The UART interfaces support configurable baud rates. Hardware flow control is not supported.

The UART1 is enabled if **D\_SEL** pin of the module is left open or "high".

Symbol	Parameter	Min	Max	Unit
R <sub>U</sub>	Baud rate	4800	8000000	bit/s

Δ <sub>Rx</sub>	Rx baud rate tolerance	-2.5%	+2.5%	-

**Table 20: ZED-X20P UART specifications**

### 5.2 SPI

The SPI interface is disabled by default. The SPI interface shares pins with UART1 and I2C and can be selected by setting **D\_SEL** = 0. The SPI interface can be operated in peripheral mode only. The SPI transfer rate based on load capacitance is shown in [Table 21](#).

Load capacitance (pF)	Min transfer rate (kB/s)	Max transfer rate (kB/s)	Max clock frequency (MHz)

## 5.3 I2C

An I2C interface is available for communication with an external host CPU in I2C standard mode, fast mode and fast mode plus. The interface can be operated only in peripheral mode with the maximum bit rate of 1000 kbit/s. The interface can make use of clock stretching by holding the SCL line LOW to pause a transaction. In this case, the bit transfer rate is reduced. The maximum clock stretching time is 20 ms. The I2C timing parameters are defined in Figure 4 and specified in Table 26.

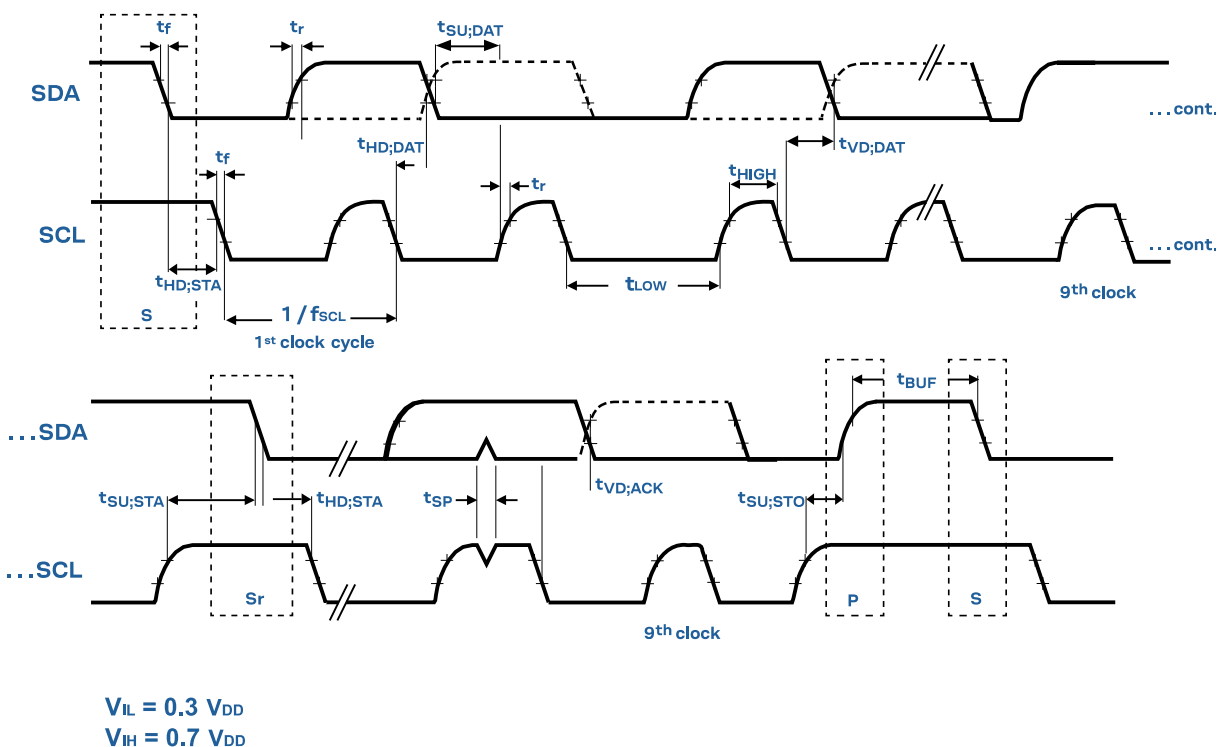

Figure 4: ZED-X20P I2C peripheral specification

**Table 26: ZED-X20P I2C peripheral timings and specifications**

The I2C interface is only available with the UART default mode. If the SPI interface is selected by using **D\_SEL** = 0, the I2C interface is not available.

## 5.4 Default interface settings

Interface	Settings
UART1 output	38400 baud, 8 bits, no parity bit, 1 stop bit. NMEA protocol with <b>GGA, GLL, GSA, GSV, RMC, VTG, TXT</b> messages are output by default. UBX and RTCM 3.4 protocols are enabled by default but no output messages are enabled by default.
UART1 input	38400 baud, 8 bits, no parity bit, 1 stop bit. UBX, NMEA and RTCM 3.4 input protocols are enabled by default.
UART2 output	38400 baud, 8 bits, no parity bit, 1 stop bit. RTCM 3.4 protocol is enabled by default but no output messages are enabled by default. NMEA protocol is disabled by default.
UART2 input	38400 baud, 8 bits, no parity bit, 1 stop bit. RTCM 3.4 protocol is enabled by default. SPARTN protocol is enabled by default. NMEA protocol is disabled by default.
I2C	Available for communication in the Fast-mode with an external host CPU in peripheral mode only. Default messages activated as in UART1. Input/output protocols available as in UART1. Maximum bit rate 400 kb/s.
SPI	Allow communication to a host CPU, operated in peripheral mode only. Default messages activated as in UART1. Input/output protocols available as in UART1. SPI is not available unless <b>D_SEL</b> pin is set to low (see section <b>D_SEL</b> interface in Integration manual[1]).

**Table 27: Default interface settings**

<sup>19</sup> External device must provide a hold time of at least one transition time (max 300 ns) for the SDA signal (with respect to the min  $V_{IH}$  of the SCL signal) to bridge the undefined region of the falling edge of SCL.

<sup>20</sup> The maximum  $t_{HD;DAT}$  must be less than the maximum  $t_{VD;DAT}$  or  $t_{VD;ACK}$  with a maximum of 0.9  $\mu s$  by a transition time. The maximum must only be met if the device does not stretch the low period  $t_{LOW}$  of the SCL signal. If the clock stretches the SCL, the data must be valid by the set-up time before it releases the clock.

Refer to the applicable Interface description for information about further settings.

By default, ZED-X20P outputs NMEA messages that include satellite data for all GNSS bands being received. This results in a high NMEA output load for each navigation period. Make sure the UART baud rate used is sufficient for the selected navigation rate and the number of GNSS signals being received.
